

The key to understanding biodiversity lies in the scale of observation.

This is a core concept addressed by MARBEFES; work to understand biodiversity across the European domain must include this range of circumstances and the BBTs are selected specifically to address this – covering subtropical to subarctic.

The BBTs are the foundation of the MARBEFES research, providing both a testing ground and a mechanism for broadening the knowledge and evidence on biodiversity status and changes across the European continent, from BBT in Arctic, Baltic Atlantic and Mediterranean.

Meet the first one, Baltic BBT at this short movie, representing how important the scale is. It’s a crucial tool for understanding and preserving our planet’s biodiversity.
